                                           Contacting the cells with calreticulin (or its fragments).

Fragments of calreticulin causes at least 40% inhibition of anglogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tumor that is associated with newascularization (e.g. diabetic neuropathy, retrolental fibroplasia, truchoma, neovascular glaucoma, psoriasis, anglofibromas, immune inflammation, atheroscierosis, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, contact lens overwear, Crohn's disease, non-immune inflammation, contact lens systemic lupus exythroaditis, contact lens systemic lupus exythroaditis, solecodemic systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoidosis and primary biliary cirrhosis). The method may with a strong for treating/inhibiting tumor growth especially

Fragments of calreticulin causes at least 40% inhibition of anglogenesis, tunnor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tunnor that is associated with necvascularization (e.g. diabetic neuropethy, retrolental fibroplasia, trachoma, necvascular glaucoma, psoriatisis, anglofibromas, immune inflammation, atherosclerosis, excessive wound repair, retinal necvascularization, macular degeneration, corneal graft rejection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting endothelial cell growth and angiogenesis using calreticulin,
used for inhibiting angiogenesis in a patient. The angiogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. diabetic neuropathy, retrolental fibroplasia, trachoma, neovascular glaucoma, psoriaais, angiofibromas, immune inflammation, atherosclerosis, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis, Goodpasture's syndrome, systemic vasculitis, soleroderma, sjorgen's syndrome, asrcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially

A novel method of inhibiting endothelial cell growth comprises

C contexting the calls with calreticulin (or its fragments/variants).

Fragments of calreticulin causes at least 40% inhibition of angiogenesis, tumor growth and/or endothelial cell growth (claimed). The angiogenesis, tumor growth and/or endothelial cell growth (claimed). The canglogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. diabetic neuropathy, retrolental clibroplasia, trachoma, neovascular glaucoma, psoriasis, angiofibromas, immunue inflammation, atheroscolercis, excessive wound repair, retinal covascularization, macular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, contact lens overwear, Crohn's disease, non-immune inflammation, contact lens overwear, systemic lupus erythromatosus, thyroiditis, contact lens syndrome, systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoldosis and primary bliliary cirrhosis). The method may collobe used for treating/inhibiting tumor growth especially
                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MBP-calreticulin, maltose binding protein; angiogenesis; inhibition; endothelial cell; anti-angiogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting endothelial cell growth and angiogenesis using calreticulin,
contact lens overwear, Crohn's disease, non-immune inflammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis, Goodpasture's syndrome, systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially Raposi's sarcoma (claimed).
                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence comprises recombinant human calreticulin (AAY92350)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        endothelial cell; anti-angiogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inhibiting endothelial cell growth and angiogenesis using calreticulin, useful for suppressing tumor growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant human MBP-calreticulin comprises the sequence of human calreticulin (see AAY92349) without the 17 N-terminal amino acids. A novel method of inhibiting endothelial cell growth comprises contacting the cells with calreticulin (or its fragments/variants). Fragments of calreticulin causes at least 40% inhibition of anglogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. diabbetic neuropathy, retrolent fibroplasia, trachoma, neovasculariguacoma, psoriasis, anglofibromas, immune inflammation, atherosclerosis, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         contact lens overwear, Crohn's disease, non-immune inflammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis, Goodpasture's syndrome, systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially

                                                                                                                                                                                                                                                                                                                       The present sequence is calreticulin. It and a C-domain derived peptide (AAM06736) are useful for treating a patient to inhibit restenosis. The calreticulin-type opds. are administered either parenterally, intravenously or via a catheter and can target areas of vascular damage to inhibit or prevent restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                      ö
                                                   This sequence is calreticulin, a homologue of Clq and collectin receptor (CCJqR). The invention relates to the use of a cClqR binding domain in a medicament to effect complement ublquiin (CUB) functionality, and an inhibitor of the cClqR binding domain in a medicament to inhibit cub functionality. The cClqR binding domain, or its inhibitor, can be used to treat a human or animal body. Particularly an inhibitor, is used to complement activation involved in the initiation and maintenance of inflammation, for example in myocardial infarction, brain ischaemia stroke), gut ischaemia, rheumatoid arthritis, systemic lupus exthematosus, burns, immune complex nephritis, and to treat amyloid plaques in Alzheimer's disease. The use of cClqR binding domain or inhibitor enables the CUB domain functionality to be modulated using a

A novel method of inhibiting endothelial cell growth comprises contacting the cells with calreticulin (or its fragments/variants). Fragments of calreticulin causes at least 40% inhibition of angiogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting angiogenesis in a patient. The angiogenesis is associated with a disease other than a tumor that is associated with
                                                                                                                                                                                                                 neovascularization (e.g. diabetic neuropathy, retrolental fibroplasia, trachoma, neovascular glaucoma, psoriasis, angiofibromas, immmune inflammation, atherosolerosis, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis, Goodpasture's syndrome, systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially Kaposi's sarcoma (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Flea calreticulin protein PCtCall589 (AAW04171) is a calcium-binding protein found in the salivary glands of Ctenocephalides fells. Its amino acid sequence was deduced from a cDNA clone (AAT39516) obtd. from a salivary gland cDNA library. Recombinant PCtCall589 can be produced in host cells transformed with a vector carrying calreticulin nucleic acids. Calreticulin alters the blood feeding behaviour of haematophagous insects and can be administered to an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hacmatophagous insect calreticulin protein - used to reduce insect infestation and desensitise patients to allergic dermatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Calreticulin; flea; haematophagous insect; allergic dermatitis; vaccine; therapy; PCtCal403.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Contacting the cells with calreticulin (or its fragments/variants). Fragments of carreticulin causes at least 40% inhibition of angiogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting angiogenesis in a patient. The angiogenesis is ussociated with a disease other than a tumor that is associated with necouscularization (e.g. diabetic neuropathy, retrolental fibroplasis, trachoma, necoascular glaucoma, psoriasis, andiofibromas, immune inflammation, atherosclerosis, excessive wound repair, retinal necoascular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, promuticed arthritis, systemic lupus erythromatosus, thyroiditis, Gowdputture's syndrome, systemic lusacularity sciencesus, soleroderma sjorgen's syndrome, sarcoidosis and primary billiary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially
                                                                                                                                                                                                                                                                                                                              MAP-calreticulin; maltose binding protein; anglogenesis; inhibition; cyndorheilal cell; anti-anglogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-artherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inhibiting endothelial cell growth and angiogenesis using calreticulin, useful for suppressing tumor growth
                                                                                                                                 Gaps
animal to reduce infestation. It reduces calreticulin activity in insects, so reducing the insect burden on an animal. Calreticulin can be used to elicit an immune response, thereby desensitising an animal to allergic dermatitis caused by fleas, mosquitoes or

The sequence was deduced from a cDNA clone lambda RAL-1 prepd. from RAM isolated from nodules excised from patients infected with O. volvulus. The N-terminal is incomplete, however Abs which specifically bind to protein prepd. from induced cultures of lambda RAL-1 lysogens recognise a single polypeptide of mol. wt. 42.000 in extracts of adult worms. Analysis deduced sequence suggests that it encodes a protein of mol. wt. 39.130. If the antigen is not subject to post-translational processing this suggests that most of the coding sequence is present. The three repeats are highly hydrophilic regions likely to be exposed on the surface of the antigen and highly immunogenic. Recombinant antiginal antigen expressed by the clone can be used stimulate T-cells of individuals infected by the parasite to proliferate and may be used as the basis for a vaccine against Onchocerciasis or river

Sequence

S

ö This sequence represents the human neural cell adhesion molecule (NCAM) amino acid sequence. NCAM is found in three forms, two of which are transmembrane forms, while the third is attached via a lipid anchor to the cell membrane. All three NCAM forms have an extracellular structure consisting five immunoglobulin domains (Ig domains). The Ig domains are numbered 1 to 5 from the N-terminal. The invention relates to a compound containing a peptide which binds to the NCAM Igl domain. The compound binds to NCAM Igl/Ig2 domains, and is capable of stimulating or promoting neurite outgrowth from NCAM presenting cells, and is also capable of promoting the proliferation of NCAM presenting cells. The compound may be used in the treatment of normal, degenerated or damaged NCAM presenting cells. The compound may in particular be used to treat diseases of the NCAM; neural cell adhesion molecule; Igl; immunoglobulin domain 1; neurite outgrowth promoter; proliferation; nerve damage; sclerosis; impaired myellnation; stroke; Parkinson's disease; memory; schizophrenia; Alzheimer's disease; diabetes mellitus; circadian clock; nephrosis; Compositions that bind neural cell adhesion molecules useful for treating disorders of the nervous system and muscles e.g. Alzheimer's and Parkinson's diseases -Gaps Jensen PH; ; treatment; prosthetic nerve guide; treatment; nervous system Length 336; 3; Indels Human NCAM 140kD isoform precursor amino acid sequence. Also provided is a method for inhibiting synaptic stability in a mammal that comprises administering to a mammal a therapeutically effective amount of a CAM agent that inhibits cadherin-mediated adhesion, where the agent comprises a cyclic peptide having a peptide ring, and where the sequence His-Ala-val is present within the peptide ring, and where the sequence His-Ala-adhesion modulating agents that inhibit cadherin-mediated adhesion. They can be used in a method for inhibiting synaptic stability in mammals. The agents can be used to treat diseases or other conditions characterized by undesirable cell adhesion or to facilitate drug delivery to a specific
            damage, traumatic nerve damage, japaired myelination of nerve fibres, conditions resulting from a stroke, Parkinson's disease, Alzheimer's disease, dementias, sclerosis, nerve degeneration associated with disease dementias, sclerosis, nerve degeneration associated with neuro-muscular transmission and schizophrenia. Conditions affecting the neuro-muscles may also be treated with the compound, such as conditions associated with impaired function of neuromuscular connections (e.g. genetic or traumatic shock or traumatic atrophic muscle disorders). Conditions of the gonads, pancreas (e.g. diabetes mellitus types I and II), kidney (e.g. nephrosis), heart, liver and bowel may also be treated using the compound. The compound is used in a prosthetic nerve guide, and also to stimulate the ability to learn, and to stimulate the memory of a
                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to methods using cadherin modulating agents, particularly paptides containing the sequence HAV or antibodies, for enhancing or inhibiting cadherin-mediated cell adhesion. The methods can be used to treat diseases or other conditions characterized by undestruble cell adhesion or to facilitate drug delivery to a specific tissure or tumnor (such as bladder tumnours, ovarian tumnours or melanomas). They can also be used to enhance cell adhesion (e.g. supplement or rehancing and/or directing neurite outgrowth. The methods can also be used for treating demyelinating neurite outgrowth. The methods can also be used for treating demyelinating neurite outgrowth. The methods can also be used for treating demyelinating neurite outgrowth. The methods can also be used for engancing drug delivery, treating cancers (such as carcinomas, leukenia or melanomas), inhibiting andogenesis, e.g. inducting adhesion of foreign tissue implanted in a mammal, andiogenesis, incenting the immune system, for chumuries or inhibiting symptic stability, treating spinal cord
                                                                                                                                                                           ö
tissue or tumour. Alternatively the agents may be used to enhance cell adhesion (e.g. to supplement or replace stitches or to facilitate wound healing) or to enhance or direct neurite outgrowth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cadherin; modulating agent; cadherin-mediated cell adhesion; cancer; drug delivery; bladder timour; ovarian tumour; melanoma; cell adhesion; wound healing; neurite outgrowth; demyelinating neurological disease; multiple sclerosis; carcinoma; leukemia; melanoma; ungjogenesis; CAR; apoptosis; diabetes; rheumatoid arthritis; immune system; pregnancy; vusopermeability; spinal cord injury; synaptic stability.

Blochim. Blophys. Acta 1158:339-344(1993).
-i- FUNCTION: THIS PROTEIN BINDS CALCIUM. THERE ARE BOTH HIGH AND LOW AFFINITY CALCIUM BINDIS GALCIUM. THERE ARE BOTH HIGH AND LOW AFFINITY CALCIUM BINDING STITES.
-i- SUBGELLULAR LOCATION: ENDOPLASMIC RETICULUM LUMEN.
-i- SUBLEATIY: BELONGS TO THE CALREFICULIN FAMILY.
-i- CAUTION: MAS ORIGINALLY (REE. 2) THOUGHT TO BE D-BETA-HYDROXYBUTYRATE DEHYDROGENASE.

-!- FUNCTION: THIS PROTEIN BINDS CALCIUM. THERE ARE BOTH HIGH AND LOW AFFINITY CALCIUM-BINDING SITES.
-!- SUBBAIT: MONOMER (EN SIMILARITY).
-!- SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM LUMEN.
-!- SIMILARITY: BELONGS TO THE CALRETICULIN FAMILY.

-!- FUNCTION: THIS PROTEIN BINDS CALCIUM. THERE ARE BOTH HIGH AND LOW AFFINITY CALCIUM-BINDING SITES.

-!- SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM LUMEN.

-!- SIMILARITY: BELONGS TO THE CALRETICULIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                  "A C. elegans gene encodes a protein homologous to mammalian

Submitted (DEC-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN BINDS CALCIUM. THERE ARE BOTH HIGH AND
LOW AFFINITY CALCIUM-BINDING SITES (BY SIMILARITY).
-!- SUBCELLOLAR LOCATION: ENDOPLASMIC RETICULUM LUMEN.
-!- SIMILARITY: BELONGS TO THE CALRETICULIN FAMILY.
                                                                                                                                                                                                                                                                                                              63.8%; Score 619.5; DB 1; Length 395; 63.5%; Pred. Submitted (OCT-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN BINDS CALCIUM. THERE ARE BOTH HIGH AND
LOW AFFINITY CALCIUM-BINDING SITES (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: BENDOPLASMIC RETICULUM LUMEN (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE CALRETICULIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          64 F-EPFSNKGOTLVVQFTVKHEQNIDCGGGYVKLFPNSLDQTDMHGDSEYNIMFGPDICGP 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Komatsu S., Li Z.;
"Cloning the cona encoding a calcium-binding protein which involved in "Cloning the cona encoding a calcium-binding protein which involved in schoneration of rice cultured suspension cells.";
Submitted (DEC-1998) to the EMBL/Genbank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN BINDS CALCIUM. THERE ARE BOTH HIGH AND LOW AFPIRITY CALCIUM-BINDING SITES (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: EMDOPLASMIC RETICULUM LUMEN (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE CALRETICULIN FAMILY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant human MBP-calreticulin comprises the sequence of human calreticulin (see AAY23149) without the 17 N-terminal amino acids.

A novel method of inhibiting endothelial cell growth comprises contacting the cells with calreticulin (or its fragments/variants).

Fragments of calreticulin causes at least 40% inhibition of unglogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The not secretic with meovascularization (e.g. diabetic neuropathy, retrolners it brophasia, trachoma, neovascularization (e.g. diabetic neuropathy, retrolners incontact lens overwear, crohn's disease other than a tumor that is neovascularization, macular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, contact lens overwear, Crohn's disease, non-immune inflammation, systemic vasculitis, acleroderma, Sjorgen's goodpasture's syndrome, systemic vasculitis, acleroderma, Sjorgen's syndrome, sarcoldosis and primary billary cirrhosis). The method may warded the used for treating/inhibiting tumor growth especially
                                                                                                                                                                                                                                     MBP-calreticulin; maltose binding protein; anglogenesis; inhibition; endothelial cell; anti-anglogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting andothelial cell growth and angiogenesis using calreticulin, useful for suppressing tumor growth

Synthetic peptides corresp. to an epitopic core of Ro antigen are expressed recombinantly to detect autosmutibodies, for identification of autoimmune diseases. These epitopes are AAs 24.36, 23-36, 188-209, or 241-255. The peptides may be substd. for ribonucleoprotein particle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              121 GPGTKKVHVIFNYKGKNVLINKDIRCKDDEFTHLYTLIVRPDNTYEVKIDNSQVESGSLE 180

```
A novel method of inhibiting endothelial cell growth comprises
contacting the cells with calreticulin (or its fragments/variants).

Pragments of calreticulin causes at least 40% inhibition of angiogenesis,
tumor growth and/or endothelial cell growth (claimed). The method may be
used for inhibiting angiogenesis in a patient. The angiogenesis is
associated with a disease other than a tumor that is associated with
neovascularization (e.g. diabetic neuropathy, retrolental fibroplasia,
trachoma, neovascular glaucoma, psoriasis, angiofibromas, immune
contactnessolarosclerosis, excessive wound repair, retinal
neovascularization, macular degeneration, corneal graft rejection,
contact lens overwear, Crohn's disease, non-immune inflammation,
rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis,
Goodpasture's syndrome, systemic vasculitis, soleroderma, Sjorgen's
syndrome, sarcoidosis and primary biliary cirrhosis). The method may
                                                                                                                                                                                                                                                                                                               MBP-calreticulin; maltose binding protein; angiogenesis; inhibition; endothelial call; anti-angiogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     endothelial cell growth and angiogenesis using calreticulin, suppressing tumor growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (USSH ) US DEPT HEALTH & HUMAN SERVICES.

```
This sequence is calreticulin, a homologue of C1q and collectin receptor (CC1qR). The invention relates to the use of a cC1qR binding domain in a medicament to effect complement ubiquitin (CUB) functionality, and an inhibitor of the cC1qR binding domain in a medicament to inhibit CUB functionality. The cC1qR binding domain, or its inhibitor, can be used to treat a human or animal body. Particularly an inhibitor is used to treat complement activation involved in the initiation and maintenance of inflammation, for example in myccardial infarction, brain ischaemia (stroke), gut ischaemia, rheumatoid arthritis, systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Clq and collectin receptor; cClqR binding domain; complement ubiquitin; CUB functionality; inhibitor; complement activation; inflammation; myocardial infarction; brain ischaemia; gut ischaemia; amyloid plaque; rheumatoid arthritis; systemic lupus erythematosus; Alzheimer's disease; immune complex nephritis; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is calreticulin. It and a C-domain derived peptide (AAW06736) are useful for treating a patient to inhibit restenosis. The calreticulin-type opds. are administered either parenterally, intravenously or via a cathefer and can target areas of vascular damage to inhibit or prevent restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            104 DMHGDSEYNIMFGPDICGPGTKKVHVIFNYKGKNVLINKDIRCKDDEFTHLYTLIVRPDN 163

A novel method of inhibiting endothelial cell growth comprises

contacting the cells with calreticulin (or its fragments/variants).

Cragments of calreticulin causes at least 40% inhibition of anglogenesis,

tumor growth and/or endothelial cell growth (claimed). The method may be

cused for inhibiting anglogenesis in a patient. The anglogenesis is

associated with a disease other than a tumor that is associated with

cused for inhibiting anglogenesis in a patient. The anglogenesis is

neovascularization (e.g. diabetic neuropathy, retrolental fibroplasis,

trachoma, neovascular glaucoma, psoriasis, angiofibromas, immune

inflammation, atherosclerosis, excessive wound repair, retinal

contact lens overwear, Crohn's disease, non-immune inflammation,

rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis,

syndrome, sarcoidosis and primary biliary cirrhosis). The method may

also be used for treating/inhibiting tumor growth especially

Kaposi's sarcoma (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MBP-calreticulin; maltose binding protein; anglogenesis; inhibition; endothelial cell; anti-anglogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
cytostatic; dermalogical; immunosuppressive; antlinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting endothelial cell growth and angiogenesis using calreticulin,

This sequence comprises recombinant human calreticulin (AAY92350)
missing the N-terminal 120 amino acids.

A novel method of inhibiting endothelial cell growth comprises
contacting the cells with calreticulin (or its fragments/variants).

Fragments of calreticulin causes at least 40% inhibition of
mathod may be used for inhibiting angiogenesis in a patient. The
angiogenesis, tumor growth and/or endothelial cell growth (claimed). The
method may be used for inhibiting angiogenesis in a patient. The
angiogenesis is associated with a disease other than a tumor that is
associated with neovascularization (e.g. diabetic neuropathy, retrolental
fibroplasia, trachoma, neovascular glaucoma, psoriasis, angiofibromas,
immune inflammation, atherosclarosis, excessive wound repair, retinal
neovascularization, macular degeneration, corneal graft rejection,
contact lens overwear. Crohn's disease, non-immune inflammation,
rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis,
Goodpasture's syndrome, systemic lupus erythromatosus, thyroiditis,
syndrome, sarcoldosis and primary biliary cirrhosis). The method may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MBP-calreticulin; maltose binding protein; anglogenesis; inhibition; endothelial cell; anti-anglogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
                                                                                                                                                                                                                                                   Inhibiting endothelial cell growth and angiogenesis using calreticulin, useful for suppressing tumor growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   contacting the cells with calreticulin (or its fragments/variants). Fragments of calreticulin causes at least 40% inhibition of anglogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. diabetic neuropathy, retrolental fibroplasis, trachoma, neovascular glaucoma, psoriasis, anglofibromas, immune inflammation, atherosclerosis, excessive wound repair, retinal neovascular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MBP-calreticulin; maltose binding protein; angiogenesis; inhibition; endothelial call; anti-angiogenic; neuroprotective; antidiabetic; cytoStatic; dermalogical; immunosuppressive; antinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-arthritic; ophthalmic.
                                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting endothelial cell growth and angiogenesis using calreticulin, useful for suppressing tumor growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Goodpasture's syndrome, systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially Raposi's sarcoma (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

                                                                                                                                                               contacting the cells with calreticulin for its fragments/variants).

Fragments of calreticulin causes at least 40% inhibition of anglogenesis, tragment growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. diabetic neuropathy, retrolental fibroplasis, trachoma, neovascular glaucoma, psoriasis, anglofibromas, immune inflammation, atheroscierosis, excessive wound repair, retinal neovascularization, mecular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, remained arthritis, systemic lupus erythromatosus, thyroiditis, docopasture's syndrome, systemic lupus erythromatosus, thyroiditis, syndrome, systemic lupus erythromatosus, thyroiditis, syndrome, sarcoidosis and primary biliary cirrhosis). The method may when he can be add for treating/inhibiting tumor growth especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Clq and collectin receptor; cclqR binding domain; complement ubiquitin; CUB functionality; inhibitor; complement activation; inflammation; myocardial infarction; brain ischaemia; gut ischaemia; amyloid plaque; rheumatoid arthritis; systemic lupus erythematosus; Alzheimer's disease;
                                                                                Inhibiting endothelial cell growth and angiogenesis using calreticulin, useful for suppressing tumor growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This sequence is a clq and collectin receptor (cclqR) binding domain in a medicament to effect complement ubiquitin (cUB) functionality, and an inhibitor of the cclqR binding domain in a medicament to effect complement ubiquitin (cUB) functionality, and an inhibitor of the cclqR binding domain in a medicament to inhibit cuB functionality. The cclqR binding domain, or its inhibitor, can be used to treat a human or animal body. Particularly an inhibitor, is used to treat complement activation involved in the inhibitor and maintenance of inflammation, for example in myocardial infarction, brain ischaemia (stroke), gut ischaemia, rheumatoid arthritis, systemic lupus erythematosus, burns, immune complex nephiltis, and to treat amyloid plaques in Alzhafmer's disease. The use of cclqR binding domain or inhibitor enables the CUB domain functionality to be modulated using a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Clq and collectin receptor; cClqR binding domain; complement ubiquitin; CUB functionality; inhibitor; complement activation; inflammation; myocardial infarction; brain ischaemia; gut ischaemia; amyloid plaque; rheumatoid arthritis; systemic lupus erythematosus; Alzheimer's disease; immune complex nephritis; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is a clq and collectin receptor (cClqR) binding domain. The invention relates to the use of a cClqR binding domain in medicament to effect complement ubjquitin (CUB) functionality, and an inhibitor of the cClqR binding domain in a medicament to inhibit CUB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of a cClqR binding domain - to modulate complement ubiquitin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 122;

The invention relates to the use of a cClqR binding domain in a medicament to effect complement ubiquitin (CUB) functionality, and an inhibitor of the cClqR binding domain in a medicament to inhibit cuB functionality. The cClqR binding domain, or its inhibitor, can be used to treat a human or animal body. Particularly an inhibitor is used to complement activation involved in the initiation and maintenance of inflammation, for example in myocardial infarction, brain isohaemia (stroke), gut ischaemia, rheumatoid arthritis, systemic lupus erythematosus, burns, immune complex nephritis, and to treat amyloid plaques in Alzheimer's disease. The use of cClqR binding domain or inhibitor enables the CUB domain functionality to be modulated using a
              t
functionality. The cClqR binding domain, or its inhibitor, can be used to treat a human or animal body. Particularly an inhibitor is used to treat complement activation involved in the initiation and maintenance of inflammation, for example in myocardial infarction, brain ischaemia (Stroke), gut ischaemia, rheumatoid arthritis, systemic lupus elythematosus, burns, immune complex nephritis, and to treat amyloid plaques in Alzheimer's disease. The use of cClqR binding domain or inhibitor enables the CUB domain functionality to be modulated using a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Clq and collectin receptor; cClqR binding domain; complement ubiquitin; CUB functionality; inhibitor; complement activation; inflammation; myocardial infarction; brain ischaemia; gut ischaemia; amyloid plaque; rheumatoid arthritis; systemic lupus erythematosus; Alzheimer's disease; immune complex nephritis; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of a cClqR binding domain - to modulate complement ubiquitin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ő

```

low molecular weight molecule.

```
The sequence was deduced from a cDNA clone lambda RAL-1 prepd. If some states of from nodules excised from patients infected with O. volvulus. The N-terminal is incomplete, however Abs which specifically bind to protein prepd. From induced cultures of lambda RAL-1 lysogens recognise a single polypeptide of mol. Wt. 42.000 in extracts of adult worms. Analysis deduced sequence suggests that it encodes a protein of mol. Wt. 39,130. If the antigen is not subject to post-translational processing this suggests that most of the coding sequence is present. The three repeats are highly hydrophilic regions likely to be exposed on the surface of the antigen and highly immunogenic. Recombinant antigen expressed by the clone can be used stimulate T-cells of individuals infected by the parasite to proliferate and may be used as the basis for a vaccine against Onchocerciasis or river
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding Onchocerca volvulos antigen - used to express recombinant antigen for vaccine against onchocerciasis or river

                                          contacting the cells with calreticulin (or its fragments/variants).

Contacting the cells with calreticulin (or its fragments/variants).

Fragments of calreticulin causes at least 40% inhibition of anglogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tumor that is associated with creatment of g. disbetic neovuscularization (e.g. disbetic neovuscularization (e.g. disbetic neuropathy, retrolental fibroplasia, trachoma, neovascular glaucoma, psoriasis, anglofibromas, immune inflammation, atherosclerosis, excessive wound repair, retinal contact lens overwear, Croim, 8 disease, non-immune inflammation, sarcoidosis and primary bilary cirrhosis). The method may ulso be used for treating/inhibiting tumor growth especially

A novel method of inhibiting endothelial cell growth comprises contacting the cells with caireticulin (or its fragments/variants). Fragments of caireticulin causes at least 40% inhibition of anglogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. diabetic neuropathy, retrolental fibroplasia, trachoma, neovascular glaucoma, psorlasis, anglofibromas,

Synthetic peptides corresp. to an epitopic core of Ro antigen are expressed recombinantly to detect autoantibodies, for identification of autoimmune diseases. These epitopes are AAs 24.36, 23-36, 188-209, or 241-255. The peptides may be substd. for ribonucleoprotein particle
                                                                                                                                                                                                                                                                                                                                                                                                           DNA sequences encoding antigenic epitope(s) of Ro 60 kD autoantigen - used in immunoassays to detect rheumatic disease

It and a C-domain derived peptide (AAW06736) are useful for treating a patient to inhibit restenosis. The calreticulin-type cpds. are administered either parenterally, intravenously or via a catheter and can target areas of vascular damage to inhibit or prevent restenosis.
neovascularization, atherosclerosis, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis, Goodpasture's syndrome, systemic lupus erythromatosus, thyroiditis, syndrome, sarcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially Kaposi's sarcoma (claimed).

A novel method of inhibiting endothelial cell growth comprises contacting the cells with calreticulin (or its fragments/variants). Fragments of calreticulin causes at least 40% inhibition of anglogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. diabetic neuropathy, retrolental fibroplasia, trachoma, neovascular glaucoma, psoriasis, anglofibromas, immune inflammation, atherosclerosis, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection, contact lens overwear. Crohn's disease, non-immune inflammation, rheumation arthritis, systemic lupus erythromatosus, thyroiditis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MBP-calreticulin, maltose binding protein; angiogenesis; inhibition; endothelial cell; anti-angiogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-atherosclerotic; gastrointestinal; anti-atheritic; ophthalmic.
                                                                                                                                                                   Inhibiting endothelial cell growth and angiogenesis using calreticulin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Goodpasture's syndrome, systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 151; DB 21;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                           This sequence is calreticulin, a homologue of Ciq and collectin receptor (CCIqR). The invention relates to the use of a cCiqR binding domain in a medicament to effect complement ubiquitin (CUB) functionality, and an inhibitor of the cCiqR binding domain in a medicament to inhibit can functionality. The cCiqR binding domain, or its inhibitor, can be used to complement activation involved in the initiation and maintenance of inflammation, for example in myccardial infarction, brain isolated in the initiation of stroken, qut ischaemia, rheumatold arthritis, systemic lupus erythematogus, burns, immune complex nephritis, systemic lupus plaques in Alzhaimer's disease. The use of CCiqR binding domain or inhibitor enables the CUB domain functionality to be modulated using a

                                                                                                                                                                                                                                                                                                                                                                                           contacting the cells with calreticulin (or its fragments/variants).

Fragments of calreticulin causes at least 40% inhibition of angiogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting angiogenesis in a patient. The angiogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. disbetic neuropathy, retrolental fibroplasia, trachoma, neovascularization (e.g. disbetic neuropathy, retrolental fibroplasia, trachoma, neovascular glaucoma, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection, contact lens overwear, Crohn's disease, non-immune inflammation, reumatoid arthritis, systemic lupus erythromatosus, thyroiditis, contact lens verwear, systemic lupus erythromatosus, thyroiditis, contact macoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially kaposi's sarcoma (claimed).
                                                                                                                                                                                                                                                                                                                               0;

A novel method of inhibiting endothelial cell growth comprises contacting the cells with calreticulin (or its fragments/variants). Fragments of calreticulin causes at least 40% inhibition of angiogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting angiogenesis in a patient. The angiogenesis is associated with a disease other than a tumor that is associated with neovascularization (e.g. diabetic neuropathy, retrolental fibroplasia, trachoma, neovascular glaucoma, psoriasis, angiofibromas, immune inflammation, atherosclerosis, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection, contact lens overwear. Crohn's disease, non-immune inflammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis,
                                                                                                                                                                                                                                                                                                                                                                                                                 Goodpasture's syndrome, systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Flea calreticulin protein PCtCall589 (AAW04171) is a calcium-binding protein found in the salivary glands of Ctenocephalides felis. Its amino acid sequence was deduced from a cDNA clone (AAT39516) obtd. from a salivary gland CDNA library. Recombinant PCtCall589 can be produced in host cells transformed with a vector carrying calreticulin nucleic acids. Calreticulin alters the blood feeding behaviour of haematophagous insects and can be administered to an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Haematophagous insect calreticulin protein – used to reduce insect infestation and desensitise patients to allergic dermatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Calreticulin; flea; haematophagous insect; allergic dermatitis; vaccine; therapy; PCtCal403.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

The N-terminal is incomplete, however Abs which specifically bind to protein prepd. from induced cultures of lumbda RAL-1 lysogens recognise a single polypeptide of mol. wt. 42.000 in extracts of adult worms. Analysis deduced sequence suggests that it encodes a protein of mol. wt. 39.130. If the antiqee is not subject to post-translational processing this suggests that most of the coding sequence is present. The three

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A novel method of inhibiting endothelial cell growth comprises contacting the cells with calreticulin (or its fragments/variants). Fragments of calreticulin causes at least 40% inhibition of angiogenesis, tumor growth and/or endothelial cell growth (claimed). The method may be used for inhibiting anglogenesis in a patient. The anglogenesis is associated with a disease other than a tumor that is associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MBP-calreticulin; maltose binding protein; angiogenesis; inhibition; endothelial cell; anti-angiogenic; neuroprotective; antidiabetic; cytostatic; dermalogical; immunosuppressive; antiinflammatory; hepatic; anti-atherosclerotic; gastrointestinal; anti-atthritic; ophthalmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 endothelial cell growth and angiogenesis using calreticulin, suppressing tumor growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            neovascularization (e.g. diabetic neuropathy, retrolental fibroplasia, trachoma, neovascular glaucoma, psoriasis, angiofibromas, immmune inflammation, atherosclerosis, excessive wound repair, retinal neovascularization, macular degeneration, corneal graft rejection, contact lens overwear, crohn's disease, non-immune inflammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis,

The method may also be used for treating/inhibiting tumor growth especially Raposi's sarcoma (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
repeats are highly hydrophillic regions likely to be exposed on the surface of the antigen and highly immunogenic. Recombinant antigen expressed by the clone can be used stimulate T-cells of individuals infected by the parasite to proliferate and may be used as the basis for a vaccine against Onchocerciasis or river

Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides the protein and coding sequences for the castor bean calreticulin protein and the calreticulin promoter sequence. In addition, the castor bean calnexin protein, coding sequence and promoter are also described. Calreticulin and calnexin are calcium binding proteins found in the endoplasmic reticulum (er). The calreticulin promoter sequence can be used in vectors to promote the expression of foreign genes, particularly resistance genes, in plant
                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecules encoding a calcium binding chaperone protein in endoplasmic reticulum, calreticulin, and calreticulin promoter sequences, useful for producing foreign gene products in plant cells \cdot

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                ·;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the protein and coding sequences for the castor bean calreticulin protein and the calreticulin promoter sequence. In addition, the castor bean calnexin protein, coding sequence and promoter are also described. Calreticulin and calnexin are calcium binding proteins found in the endoplasmic reticulum (er). The calreticulin promoter sequence can be used in vectors to promote the expression of foreign genes, particularly resistance genes, in plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecules encoding a calcium binding chaperone protein in endoplasmic reticulum, calreticulin, and calreticulin promoter sequences, useful for producing foreign gene products in plant cells -

calreticulin (see AAY92349) without the 17 N-terminal amino acids.
A novel method of Inhibiting endothelial cell growth comprises
contacting the cells with calreticulin (or its fragments/variants).
Fragments of calreticulin causes at least 40% inhibition of
angiogenesis, tumor growth and/or endothelial cell growth (claimed). The
method may be used for inhibiting angiogenesis in a patient. The
angiogenesis is associated with a disease other than a tumor that is
associated with neovascularization (e.g. diabetic neuropathy, retroiental
fibroplasia, trachoma, neovascular glaucoma, psoriasis, angiofibromas,
immmune inflammation, atherosclerosis, excessive wound repair, retinal
neovascularization, macular degeneration, corneal graft rejection,
Inhibiting endothelial cell growth and angiogenesis using calreticulin, useful for suppressing tumor growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              contact lens overwear, Crohn's disease, non-limmure infilammation, rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis, Goodpasture's syndrome, systemic vasculitis, scleroderma, Sjorgen's syndrome, sarcoidosis and primary biliary cirrhosis). The method may also be used for treating/inhibiting tumor growth especially

                                          Synthetic peptides corresp. to an epitopic core of Ro antigen are expressed recombinantly to detect autoantibodies, for identification of autoimmune diseases. These epitopes are AAs 24-36, 23-36, 188-209, or 241-255. The peptides may be substd. for ribonucleoprotein particle

contacting the cells with calreticulin (or its fragments/variants)

contacting the cells with calreticulin (or its fragments/variants)

contacting the cells with calreticulin (or its fragments/variants)

contacting the calls with calcased at least 40% inhibition of anglogenesis,

tumor growth and/or endothelial cell growth (claimed). The method may be

used for inhibiting anglogenesis in a patient. The anglogenesis is

associated with a disease other than a tumor that is associated with

neovascularization (e.g. diabetic neuropathy, retrolental fibroplasia,

trachoma, neovascular glaucoma, psoriasis, angiofibromas, immmune

inflammation, atherosclerosis, excessive wound repair, retinal

neovascularization, macular degeneration, corneal graft rejection,

contact lens overwear, Crohn's disease, non-immune inflammation,

rheumatoid arthritis, systemic lupus erythromatosus, thyroiditis,

doodpasture's syndrome, systemic vasculitis, scleroderma, Sjorgen's

syndrome, sarcoidosis and primary biliary cirrhosis). The method may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

               This sequence is calreticulin, a homologue of Clq and collectin receptor (cClqR). The invention relates to the use of a cClqR binding domain in a madicament to affect complement ubiquitin (CUB) functionality, and an inhibitor of the cClqR binding domain in a medicament to inhibit CUB tunctionality. The cClqR binding domain, or its inhibitor, can be used to treat a human or unimal body. Particularly an inhibitor, can be used to complement activation involved in the initiation and maintenance of inflummation, for example in mycardial infarction, brain ischaemia (HITOKO), gut ischaemia, rheumatoid arthritis, systemic lupus erythematosus, burns, immune complex nephritis, and to treat amyloid plagues in Alzhaimar's disease. The use of cClqR binding domain or inhibitor enables the CUB domain functionality to be modulated using a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The prement sequence is calreticulin. It and a C-domain derived peptide (AAW06736) are useful for treating a patient to inhibit restenosis. The

Its amino acid sequence was deduced from a cDNA clone (AA739516)
obtd. from a salivary gland cDNA library. Recombinant PCtCall589
calreliculin nucleic acids. Calreliculin alters the blood feeding
behaviour of haematcphagous insects and can be administered to an
animal to reduce infestation. It reduces calreliculin acilvity in
insects, so reducing the insect burden on an animal. Calreliculin
can be used to elicit an immune response, thereby desensitising an
culicoides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Calreticulin; flea; hacmatophagous insect; allergic dermatitis;

Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: cytostatic, impunostimulant; antiproliferative; cardiant; antiarrhythmic; antiviral; antibacterial; antifungal; antiparasitic; neuroprotective; nootropic; antiinflammatory; antianglogenic; anti-HIV; and antiarteriosclerotic. The present invention provides the protein and coding sequences for the castor bean calreticulin protein and the calreticulin promoter sequence. In addition, the castor bean calnexin protein, coding sequence and
                                                                                              The present invention provides the protein and coding sequences for the castor beam calreticulin protein and the calreticulin promoter sequence. In addition, the castor beam calnexin protein, coding sequence and promoter are also described. Calreticulin and calnexin are calcium binding proteins found in the endoplasmic reticulum (er). The calreticulin promoter sequence can be used in vectors to promote the expression of foreign genes, particularly resistance genes, in plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecules encoding a calcium binding chaperone protein in endoplasmic reticulum, calreticulin, and calreticulin promoter sequences, useful for producing foreign gene products in plant cells \cdot
